The Cinector software will change the way animation movies and interactive applications are made. No abstract interfaces, no complicated handiwork. We enable you to create professional 3D apps and animations in a virtual simulated world with a fraction of resources, time and effort. We are a team of programming and media specialists. After over seven years of research and development, we are producing a unifying software solution that will disrupt the media industry and tear down the barrier between media professional and end user.

Green City Solutions addresses the global problem of air pollution by combining a special, vertical installed moss culture with our own developed Internet-of-Things-Technology (IoT). The "CityTree" has a 275x higher air filter capacity than an ordinary tree, effectively filters particulate matters, binds CO_2 and nitrous oxides and reduces the ambient temperature. It's a vertical greening surface which communicates information through a combination of real plants, technology & digital connection.

Lineupr gives organizers a budget-friendly tool to create their own mobile web apps for their events. Event apps created by Lineupr allow organizers to promote their event, constantly keep their visitors up to date and collect valuable feedback afterwards. Creating event apps has never been easier and faster. Our content management system automatically provides matching content suggestions, such as facts or links for speakers or artists. Creating convincing mobile event apps has never been easier.

ParkingSlot locates you and shows all the free of charge as well as disabled parking possibilities close to your location. After choosing a parking lot, the App navigates you to the spot as requested. If we missed a parking lot which is free of charge or handycap-accessible you´re more than welcome to help our Data Base grow by easily adding missing parking spots. Through the integrated filter users can choose between "disabled parking", "24/7-free-parking" as well as "restricted-free-parking".

ZELLMECHANIK DRESDEN develops, produces and distributes a biophysical device capable of measuring mechanical properties of single biological cells as a novel biological marker. These properties directly depend on the intrinsic cell structure, which often becomes altered as soon as changes in cell function occur. For example, cells become softer during malignant transformation and stiffer during cell differentiation.
